

Final Polished Version (Interview-Ready)

Hi, my name is **Attaluri Sai Teja**, and I've been working as a **DevOps Engineer** at **Amazon** for the past **three years**.

Currently, I'm part of an **Infosys client project**, where our team manages and supports **two major applications**. My main role is to ensure that all environments — from development to production — remain stable, secure, and optimized for smooth deployments.

Over the years, I've gained strong hands-on experience across the **DevOps lifecycle**, working with tools like **Git, GitHub, Jenkins, Maven, Ansible, Docker, Terraform**, and **Kubernetes** for container orchestration. I focus on automating build and deployment processes and maintaining consistent infrastructure across environments.

On the **cloud side**, I've worked extensively with **AWS**, using services such as **EC2, S3, Route 53, Application Load Balancer, VPC, CloudWatch, CloudTrail, ECS, ECR**, and **EKS**. I've also worked with both **cloud-based** and **on-premises data centers**, which gives me flexibility in managing hybrid environments.

Roles and Responsibilities:

In my day-to-day work, I collaborate closely with the development and testing teams for **UAT and production releases**. Our team handles **weekly releases** as well as larger **flex releases** every couple of months. I manage **Jenkins pipelines**, maintain infrastructure, and automate releases to ensure smooth deployments with **zero downtime**.

I'm also part of the **monitoring and incident response team**, where I handle alerts, troubleshoot production issues, and provide **24/7 on-call support** using **PagerDuty**. Additionally, I work with the **Linux team** during quarterly patching activities, ensuring pre- and post-patching validations without impacting live systems.

Alongside this, I focus on **automation and continuous improvement**, identifying manual tasks that can be automated using **Ansible, Shell scripting**, or **Jenkins jobs**. This has helped reduce deployment time and improve overall efficiency for our team.

To sum up, I'd describe myself as a **proactive and detail-oriented engineer** who enjoys solving challenges, improving automation, and enhancing system reliability.
